Agenda

— — —

- Colour and Aesthetics Processing
- Colour Psychology
- Colour & Memory Retention
- Colour Selection
- Other Aesthetic Principles to Consider
- Summary of Aesthetic Considerations for Creating Data Visualizations
- Comments/Questions

**How do you currently consider
aesthetic principles when
making your own data
visualizations?**

Leveraging Aesthetics in Data Visualization

- While we want our visualizations to be aesthetically pleasing to our audience, the main goal is not for a visualization to look 'good' or 'pretty'
- Colour theory and aesthetic principles can be used to assist you in disseminating your results effectively and to assist your audience in clearly identifying your key findings
- An excellent tool to have at the ready...

How We Process Visual Information

A jump back into Sensation & Perception I...

- Visual stimuli is received by the retina, then transmitted to the brain for processing
- Processing aesthetic information (i.e. colour, shape, size, position) occurs in ~13 milliseconds (Potter et al., 2014)
- Carefully selecting colour and other aesthetics in your data visualizations capitalizes on this process
 - Making your standout findings easier to process for your audience

What Makes Up A Colour?

Psychological Impact of Colour

- Colour psychology has well established that colour affects human behaviours, physiological response, and cognition
- Colour can evoke emotional responses, as well as influence mood

Colour and Emotion

- There are universal patterns in relating colour to feeling (Jonaskaite et al., 2020)
 - Black (51%) = Sadness
 - White (43%) and Blue (35%) = Relief
 - Red (68%) and Pink (50%) = Love
 - Green (39%) = Contentment
 - Yellow (52%) and Orange (44%) = Joy
 - Purple (25%) = Pleasure
 - Brown (36%) = Disgust

Other Colour Association Findings

— — —

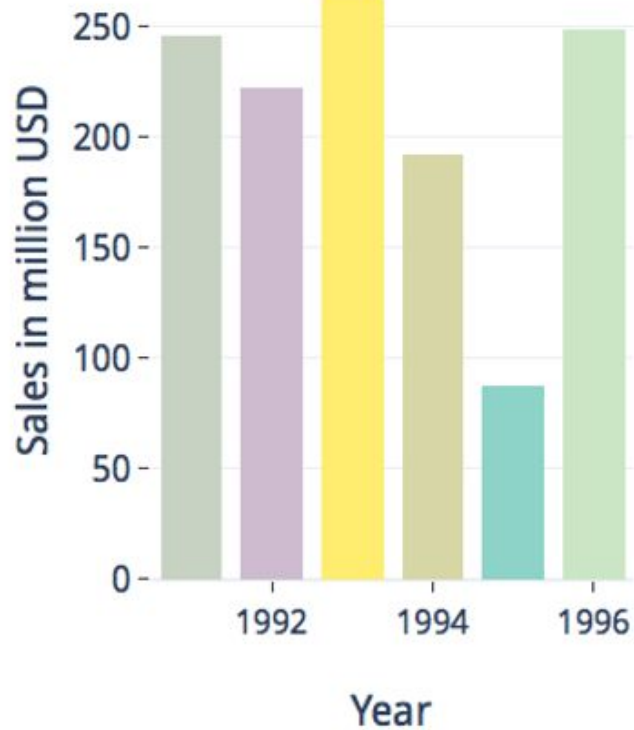

- White-coloured pills are associated with greater pain relief (Amawi & Murdoch, 2022)
 - Red-coloured pills are associated with greater stimulant properties
- Red causes people to react with greater speed and force (Elliot & Aarts, 2011)
 - Red cars are ticketed more often than cars of other colours
- Sports players in black uniforms are more likely to receive penalties than players wearing other colours (Frank & Gilovich, 1988)

Role of Colour in Memory Retention

— — —

- Colour tells your audience what they should be paying attention to
 - Colour helps in memorizing information by increasing attention levels
- Increased attention on stimuli improves the transferring of information to memory (Sternberg, 2009)
- Warm colours have a greater effect on attention compared to cool colours (Greene et al., 1983)
- We can identify colour differences much faster than we can shape differences (Pan, 2009)
 - Colours have a better ability to capture attention than other aesthetic changes

Interesting finding: Use of warm colours with blue is very often seen in news sources

- Differences between warm colours is very easy for the brain to distinguish against a cool colour, such as blue
- Warm colours can grab attention, while blue can provide a sense of trustworthiness and reliability in the source

How to Choose the Ideal Colours for Your Visualizations

- Categorical (Qualitative) palette
 - each colour is distinct
 - Ideal for categorical data

How to Choose the Ideal Colours for Your Visualizations

- Sequential palette
 - a single or multiple colours in a gradient in one direction
 - Best for ordered data

How to Choose the Ideal Colours for Your Visualizations

- Diverging palette
 - colour gradient in 2 directions
 - Best for data surrounding a clear midpoint or with extremes

Colour Palette Tools

Chroma.js Color Palette Helper – <https://gka.github.io/palettes/#/9|s|00429d,96ffea,ffffe0|ffffe0,ff005e,93003a|1|1>

1 What kind of palette do you want to create?

Palette type: sequential diverging

Number of colors:

2 Select and arrange input colors

3 Check and configure the resulting palette

correct lightness bezier interpolation

This palette is colorblind-safe.

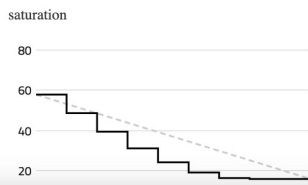

simulate: normal deut. prot. trit.

Other Aesthetic Principles to Consider

position

shape

size

color

line width

line type

Position

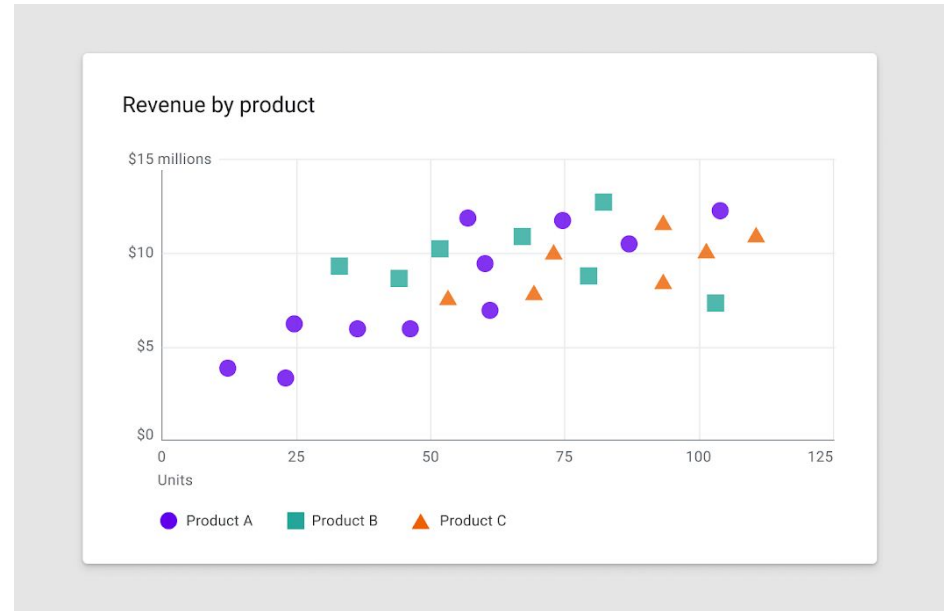

— — —

- Position of elements in your visualization can help to convey hierarchy and/or group relationships in data
- Space and positioning can be used to group related data points or to emphasize key findings
- Consistent positioning can aid in readability and comprehension for your audience

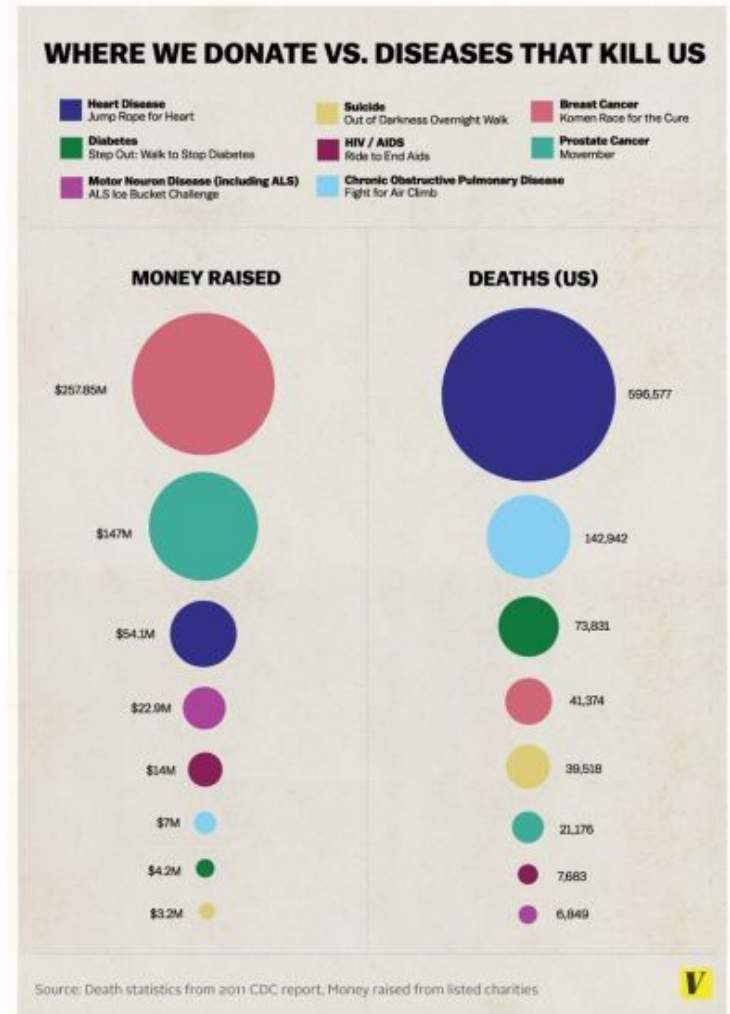

Shape

- Shape can be used to represent different categories in your data
- Choose shapes that are easily distinguishable for your audience to interpret
 - Especially important when colour differentiation is not an option
- Variation in shape can aid in ease of pattern recognition

Size

- Size can be used to represent quantitative values or to emphasize particular data points
- Larger sizes typically indicate greater magnitude or importance, while smaller sizes suggest smaller magnitudes or lesser importance
- Use size carefully to avoid distorting how your data is represented to your audience

Line Width

- Line width can be used to denote strength and importance
- Thicker lines can draw attention to and emphasize key trends or relationships
- Thinner lines can be used to represent more subtle relationships or other less important findings

Diabetes rate at all regional medical centers
PERCENTAGE OF PATIENTS WITH DIABETES

Line Type

- Different types of lines (e.g., solid, dashed, dotted) can be used to differentiate significance, time points, uncommon findings in your data etc.
- Dashed or dotted lines can represent uncertainty or indicate breaks in continuity
- Varying line types can help your audience to distinguish between different data series

Sales over time

Practical Aesthetic Considerations for Creating Data Visualizations

— — —

- Audience:
 - Understand the individual factors (e.g. cultural background, subject expertise, etc.) of your audience to create visualizations that make sense for them
- Purpose:
 - Clarify the message of your visualization before selecting colour schemes and aesthetic elements
 - Choose colours and aesthetics that support and enhance the communication of your key findings and insights
- Clarity:
 - Keep your visualizations simple to avoid overwhelming your audience
 - Use simple design elements to convey information effectively and increase ease of comprehension

Practical Aesthetic Considerations for Creating Data Visualizations

— — —

- **Colour:**
 - Select colour palettes that are visually appealing and appropriate for the topic of your research/visualization
 - Select colour palettes that are suitable for the type of data you want to visualize
- **Contrast:**
 - Ensure high contrast ratios between your text, data, and background for ease of understanding
- **Accessibility:**
 - Consider potential accessibility needs of your audience, including colour blindness and visual impairments
 - Provide alternative ways of accessing the information represented, such as text descriptions in a caption

Thanks For Listening!
